

Milestone 8 - POV of Head of Operations, Harshan - Countering His Objections

"I already have a system, why switch to DataGenie?"

That's completely fair. No one wants to replace something that works. The real question isn't whether your system works, it's whether it works fast enough, reliable enough, and for everyone who needs it.

Objection 1: "I already have a million dashboards to tell me what went wrong"

You're right, dashboards are great at showing what happened. But the difficult part usually starts after that.

When a number drops, someone still has to jump across multiple dashboards, compare dimensions, figure out what changed, and then explain it to others. That process takes time and depends on the right person being available.

What DataGenie changes is not the visibility. It reduces the effort needed after you notice something is wrong.

Instead of: *"Revenue dropped 18% - let's investigate"*

You get: *"Revenue dropped 18% - mainly due to X in region Y after Z changed"*

It's not about replacing dashboards. It's about removing the manual digging that follows them.

Objection 2: "I can get the numbers using spreadsheet formulas"

Absolutely - spreadsheets are powerful, and teams rely on them for good reason.

But here's a practical question: as Head of Operations, if the one person who built the sheet is unavailable, how long does a decision wait?

Spreadsheets work. But they come with real friction at scale - complex logic lives with a few people, files grow harder to maintain, and combining data sources takes time. Small errors can go unnoticed but still influence decisions.

DataGenie doesn't replace spreadsheets. It removes the dependency on specific individuals, makes insights accessible to everyone, and cuts down time spent on repetitive analysis.

Closing Thought

The goal isn't to change your system for the sake of it. It's to reduce time spent investigating, reliance on specific people, and delays in reacting to problems.

If your current setup already gives you fast, reliable answers with minimal effort - then DataGenie simply accelerates what you're already doing. But if getting to the *why* still takes time and coordination, that's exactly where DataGenie fits in.
