

Milestone 3 - Making customer's life more difficult

Prospect Company: Trivago

Top Story Selected: Trivago's CPC revenue is silently bleeding across regions and partners, but the business team has no way to spot it in real time without manually slicing data across dimensions like region, partner, and device by which time the damage is already done.

Dashboard:

Assumptions Made:

- The most critical pain point for Trivago is undetected CPC revenue drops, since CPC is their primary monetization model.
- Date range defaults to the last 30 days (Feb 26 – Mar 27, 2025).
- DACH region is treated as the primary focus market since it is Trivago's home region and highest revenue contributor.
- The three most important dimensions to slice by are Region, Partner, and Device, all others are secondary.

-
- Booking Holdings and Expedia are highlighted as key partners since they drive the majority of CPC bids.
 - A sudden drop at the tail end of the date range (visible in all 4 charts) is the "pain point moment" we are simulating.
 - **The dataset used for this dashboard was self-generated** all numbers (248K total CPC revenue, 154K sessions, 0.60 avg bid price, regional breakdowns, partner bid prices, device splits) are approximations only and are not sourced from any real Trivago data.
 - Daily data points across the 30-day period were manually estimated to reflect realistic trends, a steady baseline followed by a sharp drop in the last week to effectively simulate the pain point.
 - The regional revenue split (US as highest, DACH as second, UK and APAC as lower) is an assumption based on general knowledge of Trivago's market presence.
 - Partner bid prices were approximated such that Booking Holdings bids slightly higher than Expedia, with Other OTAs trailing, this reflects a realistic competitive bidding pattern.
 - Device split assumes Desktop dominates CPC revenue, Mobile is secondary, and Tablet is negligible, consistent with typical travel booking behavior

Layout Justification: The dashboard is designed so the customer hits the pain point within 3 seconds of opening it. The 3 KPIs at the top (Total CPC Revenue, Total Sessions, Avg Bid Price) give an immediate macro signal that something is off. The 4 line charts below then answer *where* and *why* - by Region, by Partner, by Sessions vs Revenue correlation, and by Device. Without DataGenie, the business team would need to run 4 separate reports across different tools to arrive at the same conclusion. Here, the drop is visible simultaneously across all dimensions, proving that DataGenie spots all the problems in a jiffy.
